Corrosion Solutions

Inhibitor Coating

OXIFREE
IC200/500

IC200/500

Inhibitor Coating is a oil-based liquid which lubricates and actively displaces moisture replacing it with a protective barrier

- Simple solutions to short term corrosion problems
- Savings to both operational and capital expenditure
- Easy and fast to apply with no process downtime
- Ready to use out of the bottle, no preparation required
- Penetrates existing corrosion
- Easily removed
- No surface preparation required
- No impact to bolt torque and friction coefficient
- Solvents free and Non-Flammable
- Lubrication for moving parts and to aide disassembly
- Works with other Oxifree products

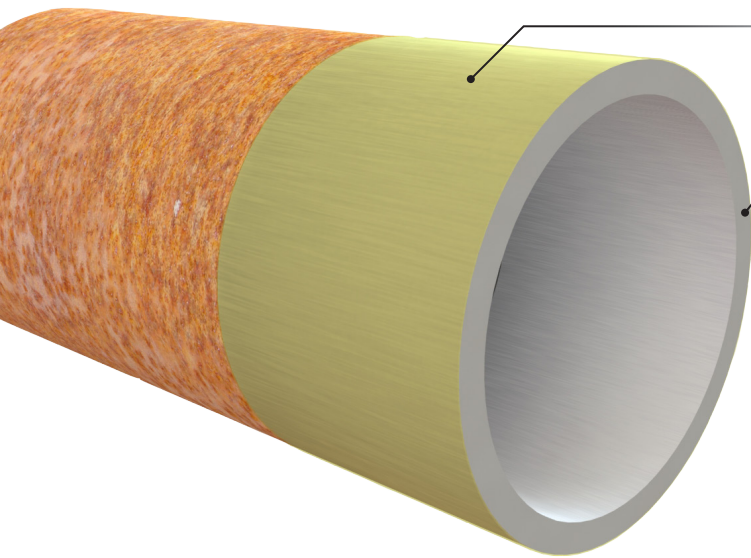

Environmentally Friendly

IC200/500

The oil prevents the ingress of air, moisture and external contaminants.

IC acts immediately wetting and actively protecting upon contact with the metal surface

IC200 provides lubrication to moving parts and bolted structures. IC500 provides a semi solid membrane for longer term preservation.

Both products are applied by a brush, working the non-solvent oil into the contours and crevices of any asset. It spreads with application and the oil will penetrate any existing corrosion and displace any moisture.

IC is suitable for: parts in storage awaiting installation, corroded surfaces, newly machine parts and as a penetrating lubricant for moving parts.

Also available in our product range

TM198

- TM198 is a thermoplastic coating for the protection of metallic components from corrosion and contamination. It contains active organic corrosion inhibitors.
- It is excellent for a range of applications including: flanges, valves, bearings, piping, parts protection (both in stock or transit), electrical conductor isolation and much more.
- Requires minimal surface preparation and can be applied in hazardous environments with ATEX/IECEX Zone 2 rated equipment.
- Certified to a wide range of international industry standards

IC has spread into the contours of the wire rope immediately, providing protection to the core.
